

From: https://github.com/chenyw-insar/bulk_downloader_asf/tree/main

- Open a Windows command line window (CMD)
- Set HOME to your root directory using `setx`
 - For example,

```
> setx HOME C:\Users\wehauer
```
- Create a **_netrc** file for storing your Earthdata Login credentials
 - In Notepad or other text editor, add these lines

```
machine urs.earthdata.nasa.gov
login username
password password
```
 - Save as a text file in your HOME directory *without any file extension*
 - Filename: `_netrc`
- Install the required Python libraries (`requests`, `hashlib`, `shutil`) in the folder you want to download to
 - Install this library one time

```
> pip install requests
```
 - Open Python to install these libraries by typing `python` at the command line. These need to be installed each time you open a new command line window

```
>>> import hashlib
>>> import shutil
```
 - Exit Python [Ctrl-Z] [Enter]
- Run the download script. Make sure the script is in the same directory that you installed the libraries in

```
> python bulk_downloader.py or > python ./bulk_downloader.py
```
